GUIDE v.32.0 0.50-SE piecewise constant least-squares regression tree for predicting `star`. Number of observations used to contruct tree is 1703. Maximum number of split levels is 11 and minimum node sample size is 8. At each split, an observation goes to the left branch if and only if the condition is satisfied. V1 = `businessparking_street`. V2 = `goodformeal_dinner`. V3 = `restaurantsgoodforgroups`. V4 = `businessparking_street`. V5 = `businessacceptscreditcards`. Set $S_1 = \{$`NA`, `full_bar`$\}$. Sample size (*in italics*) and mean of `star` printed below nodes. Second best split variable at root node is `goodformeal_dinner`.
